DATA FOUNDATIONS

1. About AuraKare Sollutions

AuraKare Sollutions provides focused support for healthcare operations, document processing, data transformation, and business process workflows. Our work is designed around the information challenges organizations face: records that need to be digitized, legacy content that needs structure, and repeatable tasks that need a clear operating model.

As a new organization, we are building our offering around clarity, careful execution, and a practical understanding of each client's requirements. We do not rely on one-size-fits-all promises. Instead, every opportunity begins with an understanding of the source material, the desired outcome, the processing rules, and the review expectations.

Our working principles

Clear scope — Requirements and output formats are agreed before work begins.

Careful handling — Sensitive information is handled within the agreed workflow.

Useful structure — The goal is data that teams can actually search, use, and maintain.

Transparent delivery — Questions and exceptions are surfaced rather than hidden.

2. What Is Data Processing & Transformation?

Data processing turns source material into organized, usable information. It may involve scanning physical records, entering or indexing data, converting files between formats, cleaning OCR output, extracting fields, or preparing structured datasets for downstream systems and analytics.

Organizations commonly explore this support when:

- A document backlog is slowing down access to important information.
- Legacy records need to become searchable, structured, or migration-ready.
- Repeatable administrative work is taking attention away from core operations.
- Data needs to be prepared for annotation, automation, or AI workflows.

3. Service Areas

Our services are organized into four practical areas that can be combined around a project or workflow.

Service area

Document Scanning & Indexing

DX | BPO Workflows

Legacy Data Transformation

AI-Ready Processing Foundations

Typical support

Digitization, file organization, indexing, and search-ready document preparation.

Structured processing support for administrative and information-driven workflows.

Data entry, abstract creation, OCR cleanup, structuring, tagging, and conversion.

Annotation, classification, tagging, and dataset preparation for machine learning use cases.

4. Detailed Service Catalogue

The exact scope is confirmed after reviewing representative source material. Available service components include:

Document processing

Document scanning, indexing, OCR cleanup, abstract creation, and searchable file preparation.

Data entry & structuring

Structured data entry, field capture, data normalization, and organizing information for handoff or migration.

Legacy transformation

Cursive or handwritten content keying, tagging, annotations, data mining, and format conversion.

Forms & applications

Survey forms, rebates, applications, and other rule-based processing workflows.

Markup conversion

HTML, XML, SGML, PDF, and other structured content conversion requirements.

AI-ready datasets

Image or content tagging, classification, annotation, and preparation for model development.

5. Core Capabilities

5.1 Requirements-led delivery

A good workflow begins with sample files, field definitions, transformation rules, exception examples, and a clear target format. These inputs help define the work before production starts.

5.2 Quality checkpoints

Review steps can be designed around the material and its risk. Options may include sample checks, validation rules, exception queues, naming conventions, and a final handoff checklist.

5.3 Flexible engagement shape

A project may begin with a small, representative sample and then expand into a recurring workflow, a defined backlog, or a phased transformation effort. The structure is selected around the client's priorities rather than a fixed package.

5.4 Security-conscious handling

Data handling, access, retention, and transfer expectations are discussed during scoping. The agreed process should reflect the sensitivity of the content and the client's own policies.

6. Sectors & Use Cases

Our service areas can support information-rich work in:

Healthcare & Insurance

Genealogy & Family History

Real Estate & Title Search

Libraries & Archives

Financial Services

Government & Public Sector

Technology & Emerging Industries

Other Enterprise Workflows

7. Engagement & Delivery Process

A clear four-step process helps turn an initial conversation into a workable scope.

- 1 Share the context** — Tell us what you are processing, why it matters, and what the final output should look like.
- 2 Review the material** — Representative samples help identify formats, rules, exceptions, and likely review needs.
- 3 Define the workflow** — We outline the service components, handoffs, checkpoints, and information needed to proceed.
- 4 Start with a focused scope** — A small starting assignment can help both sides confirm fit and refine the process.

8. Scoping Checklist

Please share what is available from the list below:

- Business objective and desired output.
- Sample files or screenshots, with sensitive content removed where necessary.
- File formats, approximate volume, and whether the work is one-time or recurring.
- Required fields, conversion rules, naming conventions, and exception examples.
- Desired timeline, priority groups, and system or delivery constraints.
- Any confidentiality, access, retention, or review requirements.

9. Pricing Framework

Pricing is scoped to the actual work. It may be shaped by:

Aspect	What is considered
Work type	Scanning, entry, conversion, indexing, transformation, annotation, or a combination
Volume	Records, pages, files, fields, batches, or recurring queue size
Complexity	Source quality, handwriting, rules, exceptions, formats, and target systems
Review level	Sampling, validation, exception handling, and handoff requirements
Timeline	Priority, dependencies, phased delivery, and requested completion window

Start with a representative sample

A sample lets us understand the material, define the workflow, and prepare a practical scope without relying on generic assumptions.

Ready to Explore a Workflow?

Let's turn complex information into a clearer, more usable process.

Tell us what you need to process
